

MongoDB – Drop Database

We can drop a database in mongoDB along with the associated data files.

```
syntax: db.dropDatabase()
```

But this will not delete the associated users in that database in version 2.6. To drop those users, we need to use dropAllUsersFromDatabase command.

Check the database you want to delete.

```
testset:PRIMARY>db imongo
```

Switch to database “imongo” before you drop the database.

```
testset:PRIMARY> use imongo
switched to dbimongo
testset:PRIMARY>db.dropDatabase()
{ "dropped" : "imongo", "ok" : 1 }
```

Verify if the database is existing by using the command show dbs.

```
testset:PRIMARY> show dbs
admin 0.031GB
local 1.577GB
```
